Pitch guide · read this before you present

Pixel Peeper

A Chrome extension that turns any website into a design lesson. You point at something you like, and it tells you **what** it is (measured exactly) and **why** it works (explained by AI).

Team: Mayur, Anam and Bhasha · Product Anatomy

1. The 20-second pitch

> "Designers learn by copying great websites, but the browser only shows code, and AI tools often make things up. **Pixel Peeper** lets you click any part of any website and get a short lesson: the **real measured values**, the **rules it passes or fails**, and **why it works**. Every claim is labelled, so you always know what is a fact and what is the AI's opinion."

2. The problem (say it simply)

- **Inspect Element is for developers.** It shows hundreds of lines of code, not design ideas.
- **Screenshots lose the details.** You save a picture, but not the font size, spacing or colours.
- **AI can invent things.** Ask an AI "why does this button work?" and it may make up numbers.
- **Ideas get lost.** Designers save inspiration in many places and forget why they saved it.

3. Our solution in three steps

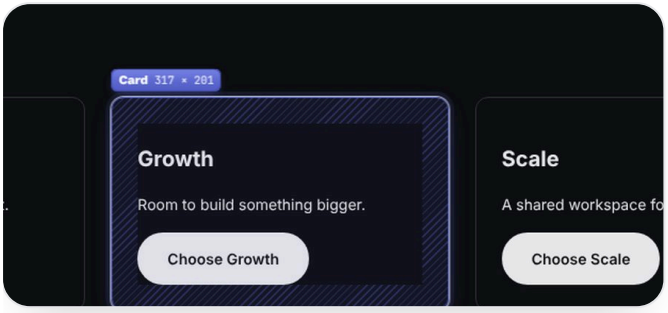

1. **Pick.** Click the detective, hover anything on the page. A smart outline snaps to whole parts (a card, a button), shows the size and the padding.
2. **Learn.** Press Get lesson. You get three tabs: **Lesson** (why it works), **Rules** (accessibility checks), **Measurements** (font, colour, spacing, size).
3. **Keep and compare.** Save good ideas to your Library, compare two or three side by side, and export a design direction (DESIGN.md, tokens or CSS).

4. What makes it special

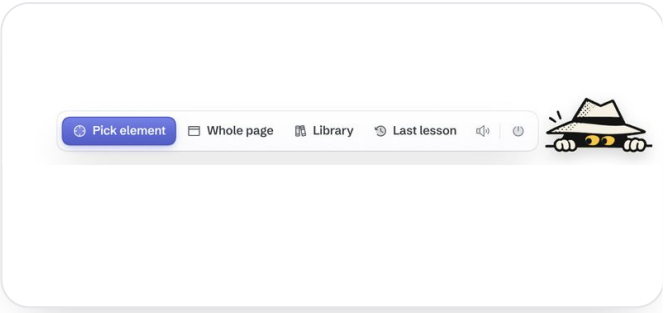

Feature	Why it matters
Measured vs Inferred	Every claim is labelled. Green means code measured it. Amber means the AI is interpreting. You always know what to trust.
No made-up numbers	Our checker removes any AI sentence that quotes a number we did not measure. The lesson even shows how many claims were removed.
Floats over the page	No side panel, so the website keeps its real size. What you study is what real users see.
Privacy first	Nothing is sent while you hover. Only when you press Get lesson does a screenshot of your selection go to the AI. The page address is not included.
Delightful	A living detective mascot, smooth motion, sounds and music in onboarding. Learning feels fun.

5. Live demo script (about 2 minutes)

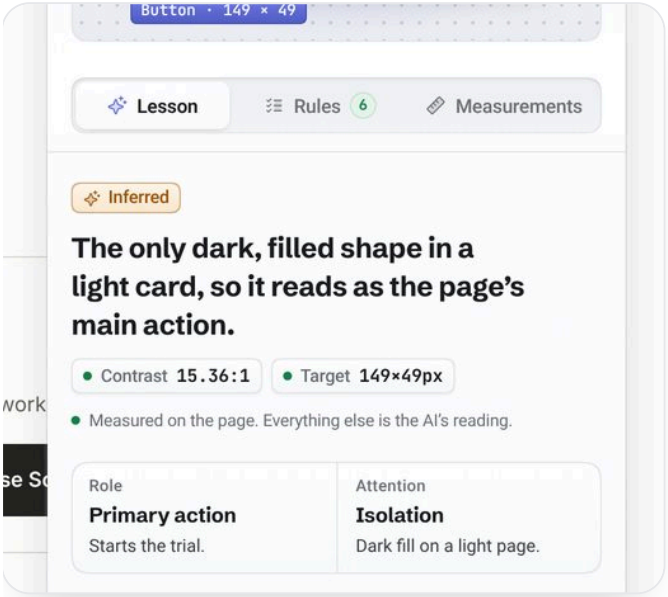

1. **Open any famous website** (for example a pricing page). Point at the detective in the bottom corner. Say: "This is our detective. He watches your cursor."
2. **Click him, then Pick element.** Move over the page slowly. Say: "See how the outline glides and snaps to whole parts. The striped area is the padding."
3. **Click the main button.** It locks with handles and the page dims. Press Enter for Get lesson.
4. **Read the headline.** Point to the amber Inferred tag and the green chips: "The AI's reading, backed by measured values."
5. **Open Rules.** "6 of 8 checks pass. These are real accessibility rules, decided by code, same answer every time."
6. **Open Measurements.** Show the font specimen, colours, contrast AA/AAA and the padding diagram. Click a value: it copies.
7. **Save idea, then open Library, then Compare** two saved ideas. "We can see exactly what differs, then build our own direction and export it."

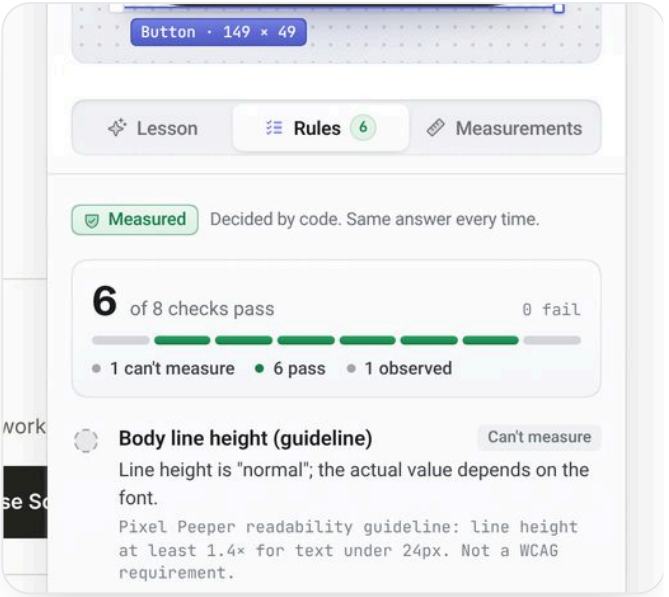

The pick: outline, size tag and padding stripes (on a dark website).

The detective's menu.

Lesson tab.

Rules tab with the score.

6. Design questions sir may ask

Q Who is this for?

Design students and working designers who learn from real websites. Also developers who want to understand design choices.

Q Why a floating window and not a side panel?

A side panel makes the website narrower, so the layout changes. Floating keeps the page exactly as real users see it. The window opens on the side away from what you picked.

Q Why these colours?

One calm indigo for actions and the selection. Green only means Measured, amber only means Inferred, red only means fail. Yellow belongs to the mascot. Each colour has one job, so the screen is easy to read.

Q Why these fonts?

Schibsted Grotesk for headings (confident, modern), Roboto for reading (very clear at small sizes), JetBrains Mono only for measured numbers (so numbers line up and look "exact"). All are free and bundled.

Q Do you have a design system?

Yes. DESIGN-SYSTEM.md in the repo lists type, colours, gradients, radius, spacing, icons, motion and sound rules. The Figma file has the three main screens with the same rules. Icons are Phosphor Duotone only.

Q Why a mascot? Is it not distracting?

It is the only playful element and it stays in the corner. It gives feedback: it searches while you pick, types while it reads, gets an idea when the lesson arrives, runs off with the file when you save. It ducks when you scroll and hides in full-screen video.

Q How did you think about accessibility?

Text meets contrast rules, every button has keyboard focus, colour never works alone (the word is always there), and "reduce motion" turns movement off. The product itself also teaches WCAG accessibility rules.

Q What about motion?

We follow Emil Kowalski's rules: smooth ease-out, under 300 milliseconds for interface parts, buttons press to 97%, nothing pops from zero. Only the mascot and the selection "lock" use a spring.

Q What was your process?

Product spec first, then user flow and information architecture, then the visual system, then Figma screens for the main flow (Lesson, Rules, Measurements), then we built them in code and tested at desktop and phone width and on dark websites.

Q What would you improve next?

Test with real students, whole-page lessons, a dark theme, and sharing a comparison with a link.

7. Technical questions sir may ask

Q What is it built with?

A Chrome extension (Manifest V3) built with WXT and TypeScript. The code is split into small packages: measure, rules, analysis, schema and store.

Q How does it measure a design?

It reads the browser's computed styles for the element you picked: font, size, weight, line height, colours, padding, radius, size, layout. Contrast is calculated with the WCAG formula. This part needs no AI and gives the same answer every time.

Q Does it break the website?

No. Our interface lives inside a Shadow DOM, so our styles never leak into the page and the page's styles never break ours. Our fonts are loaded under private names.

Q What are the Rules?

Real checks from WCAG 2.2: text contrast (AA and AAA), target size, image alt text, accessible names, plus readability guidelines (minimum text size, line height, spacing grid). The AI can also cite UX laws (like Fitts's law or the Von Restorff effect) and Nielsen's heuristics.

Q Which AI does it use?

The user's own key with Groq or Anthropic (Claude). The key is stored only on their device and sent only to that provider. Without a key, Rules and Measurements still work.

Q How do you stop the AI from making things up?

The AI must point every claim at measured facts. A validator checks each claim; if a claim quotes a number we did not measure, it is removed and counted. Claims are labelled Measured or Inferred.

Q Where is data stored?

Locally in the browser (IndexedDB for the Library, chrome.storage for settings). There is no server and no account.

Q How do you know it works?

133 automated tests (vitest) cover measuring, rules, the lesson renderer, the library and the overlay. We also check the screens with Playwright screenshots at desktop, phone and on dark sites.

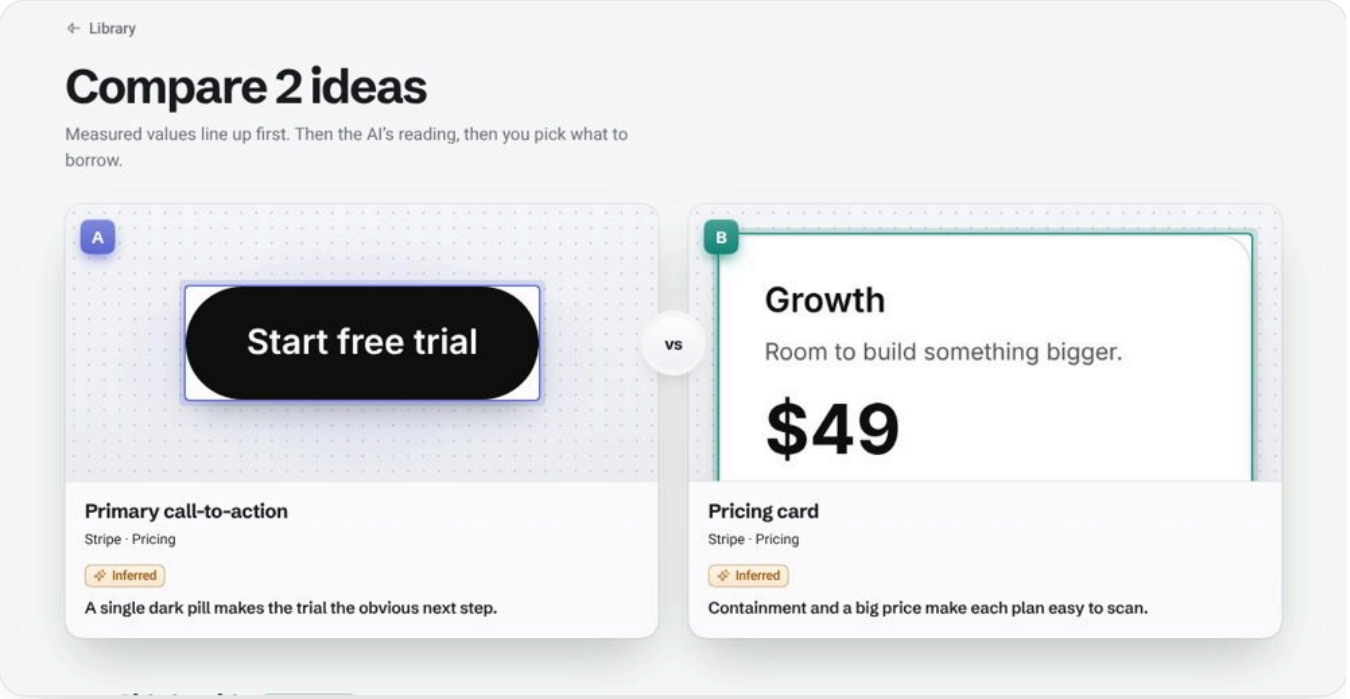

Q Where do the sounds and music come from?

They are synthesised live with the Web Audio API, so there are no audio files and nothing to license. They only play after the user clicks, and one switch turns them off.

Q How much does it cost to run?

Nothing for us: no server. The user pays their AI provider per lesson; Groq has a free tier. Measuring and rules are free.

8. Compare and Library (show this if there is time)

Compare two ideas: measured differences first, then the AI's reading, then you build your own direction and export it.

9. Tips for presenting

- **Show, don't tell.** Open the extension in the first minute.
- **Use one sentence again and again:** "Green is measured, amber is the AI's reading."
- **Have a backup:** keep screenshots ready in case the internet or the AI key fails. Rules and Measurements work offline.
- **If you don't know an answer,** say "Good question, we have not tested that yet; here is how we would find out."
- **End with the ask:** "We would like feedback from 5 design students next week to test the lessons."

10. Words that may come up

Computed style	The final style the browser actually uses for an element.
WCAG	The world standard for web accessibility.
Contrast ratio	How different text and background are. 4.5:1 is the normal minimum.
Shadow DOM	A sealed box inside a page, so our UI and the page do not affect each other.
Design tokens	Named design values (colours, sizes) that code can reuse.
Manifest V3	Chrome's current rules for how extensions are built.
